------------	-------------------------

Date of first issue: 23/04/2012	Organizational unit: Bureau Veritas Certification Holding SAS
Client: ACHEMA AB	Client ref.: Andrejus Šostakas Head of Innovation Centre

Summary:

Bureau Veritas Certification has made the 4th periodic verification of the JI Track II Project "ACHEMA UKL-7 plant N2O abatement project", JI Registration Reference Number 0089, project of ACHEMA AB, located at Jonalaukis village, Rukla county, Jonava region municipality, Lithuania and applying the AM0034 "Catalyst reduction of N2O inside the ammonia burner of nitric acid plants" v02, methodology, on the basis of UNFCCC criteria for the JI, as well as the criteria given to provide for consistent project operations, monitoring and reporting. UNFCCC criteria refer to Article 6 of the Kyoto Protocol, the JI rules and modalities and the subsequent decisions by the JI Supervisory Committee, as well as the host country criteria.

The verification scope is defined as a periodic independent review and ex post determination by the Accredited Entity of the monitored reductions in GHG emissions during the defined verification period, and consisted of the following three phases: i) desk review of the project design and the baseline and monitoring plan; ii) follow-up interviews with project stakeholders; iii) resolution of outstanding issues and the issuance of the final verification report and opinion. The overall verification, from Contract Review to Verification Report & Opinion, was conducted using Bureau Veritas Certification internal procedures.

The first output of the verification process is a list of Clarification, Corrective Action Requests, Forward Action Requests (CR, CAR and FAR), presented in Appendix A.

In summary, Bureau Veritas Certification confirms that the project is implemented as planned and described in the approved project design documents. The installed equipment being essential for generating emission reduction runs reliably and is calibrated appropriately. The monitoring system is in place and the project is generating GHG emission reductions. The GHG emission reduction is calculated accurately and without material errors, omissions, or misstatements, and is total 1164996 tons of CO2eg for the monitoring period.

Our opinion relates to the project's GHG emissions and resulting GHG emission reductions reported and related to the approved project baseline and monitoring, and its associated documents.

**VERIFICATION REPORT** 

#### 1 INTRODUCTION

ACHEMA, AB has commissioned Bureau Veritas Certification to verify the emission reductions of its JI project, the "ACHEMA UKL-7 plant N2O abatement project" (hereafter called "the project") located at Jonalaukis village, Rukla county, Jonava region municipality, Lithuania.

This report summarizes the findings of the verification of the project, performed on the basis of UNFCCC criteria, as well as criteria given to provide for consistent project operations, monitoring and reporting.

#### 1.1 Objective

Verification is a periodic independent review and ex post determination by the Accredited Independent Entity of the monitored reductions in GHG emissions during the defined verification period.

The objective of verification can be divided in Initial Verification and Periodic Verification.

UNFCCC criteria refer to Article 6 of the Kyoto Protocol, the JI rules and modalities and the subsequent decisions by the JI Supervisory Committee, as well as the host country criteria.

### 1.2 Scope

The verification scope encompasses an independent and objective review and ex-post determination of the monitored reductions in GHG emissions by the Accredited Independent Entity. The verification is based on the submitted monitoring report, the determined project design documents monitoring plan and determination report, its verification reports, the applied monitoring methodology, decisions, clarifications and guidance from the CMP and the JISC and any other information and references relevant to emission reductions resulting from the project activity. These documents are reviewed against the requirements of the Kyoto Protocol, the JI modalities and procedures and related rules and guidance and also against Lithuanian national JI quidelines.

The verification is not meant to provide any consulting towards the Client. However, stated requests for clarification, corrective and/or forward actions may provide input for improvement of the project monitoring towards reductions in GHG emissions.

Report No: LITHUANIA-VER/0048/201
-----------------------------------

#### 1.3 Verification Team

The verification team consists of the following personnel:

#### **Tomas Paulaitis**

Bureau Veritas Certification Team Leader, Climate Change Verifier Tomas Paulaitis is a lead auditor for the environment and quality management systems with over 10 years of experience and a lead GHG verifier (EU ETS, JI, CDM) with over 6 years of experience in energy, oil refinery and cement industry sectors, he was/is involved in the determination/verification of more than 50 JI projects. Tomas Paulaitis holds a Master's degree in chemical engineering.

This verification report was reviewed by:

#### Ashok Mammen

Bureau Veritas Certification, Internal Technical Reviewer Bureau Veritas Certification Internal reviewer

Dr. Mammen is a lead auditor for environment, safety and quality management systems and a lead verifier and tutor for GHG projects. He has been involved in the validation and verification processes of more than 100 CDM/JI and other GHG projects.

Report No: LITHUANIA-VER/0048/201
-----------------------------------

BUREAU VERITAS

**VERIFICATION REPORT** 

#### 2 METHODOLOGY

The overall verification, from Contract Review to Verification Report & Opinion, was conducted using Bureau Veritas Certification internal procedures.

In order to ensure transparency, the verification protocol was customized for the project, according to version 01 of the Joint Implementation Determination and Verification Manual, issued by the Joint Implementation Supervisory Committee at its 19 meeting on 04/12/2009. The protocol shows, in a transparent manner, the criteria (requirements), means of verification and the results from verifying the identified criteria. The verification protocol serves the following purposes:

- It organizes, details and clarifies the requirements a JI project is expected to meet;
- It ensures a transparent verification process where the verifier will document how a particular requirement has been verified and the result of the verification.

The completed verification protocol is enclosed in Appendix A to this report.

#### 2.1 Review of Documents

The Monitoring Report (MR) version dated 12/03/2012 submitted by submitted by ACHEMA, AB and additional background documents related to the project design and baseline, i.e. the country Law, Project Design Document (PDD), Approved CDM methodology and guidance on criteria for baseline setting and monitoring, Host party criteria, Kyoto Protocol, Clarifications on verification requirements to be checked by an accredited independent entity, were reviewed.

To address Bureau Veritas Certification corrective action and clarification requests, ACHEMA, AB revised the MR and resubmitted it on 20/04/2012. The verification findings presented in this report relate to the project as described in the PDD version 5 (dated 07/09/2009), and the Monitoring Report version dated 20/04/2012.

#### 2.2 Follow-up Interviews

On 15-16/03/2012 Bureau Veritas Certification performed on-site interviews with project stakeholders to confirm selected information and to resolve issues identified in the document review. Representatives of ACHEMA, AB were interviewed (see References). The main topics of the interviews are summarized in Table 1.

Report No:	LITHUANIA-VER/	0048/2012

**Table 1 Interview topics** 

Interviewed organization	Interview topics	
АСНЕМА, АВ	Organizational structure, responsibilities and authorities Project implementation and technology Training of personnel Quality management procedures Metering equipment control Monitoring record keeping system Environmental requirements Monitoring plan Monitoring report	

# 2.3 Resolution of Clarification, Corrective and Forward Action Requests

The objective of this phase of the verification is to raise the requests for corrective actions and clarification and any other outstanding issues that needed to be clarified for Bureau Veritas Certification positive conclusion on the GHG emission reduction calculation.

If the Verification Team assessing the monitoring report and supporting documents, identifies issues that need to be corrected, clarified or improved with regard to the monitoring requirements, it should raise these issues and inform the project participants of these issues in the form of:

- (a) Corrective action request (CAR), requesting the project participants to correct a mistake that is not in accordance with the monitoring plan;
- (b) Clarification request (CL), requesting the project participants to provide additional information for the Verification Team to assess compliance with the monitoring plan;
- (c) Forward action request (FAR), informing the project participants of an issue, relating to the monitoring that needs to be reviewed during the next verification period.

The Verification Team will make an objective assessment whether the actions taken by the project participants, if any, satisfactorily resolve the issues raised, if any, and should conclude its findings of the verification.

To guarantee the transparency of the verification process, the concerns raised are documented in more detail in the verification protocol in Appendix A.

Report No: LITHUANIA-VER/0048/201
-----------------------------------

#### 3 VERIFICATION CONCLUSIONS

In the following sections, the conclusions of the verification are stated.

The findings from the desk review of the original monitoring documents and the findings from interviews during the follow-up visit are described in the Verification Protocol in Appendix A.

The Clarification, Corrective and Forward Action Requests are stated, where applicable, in the following sections and are further documented in the Verification Protocol in Appendix A. The verification of the Project resulted in 0 Corrective Action Requests, 4 Clarification Requests, and 1 Forward Action Requests.

The number between brackets at the end of each section corresponds to the DVM paragraph.

3.1 Remaining issues and FARs from previous verifications. There are no remaining issues and FARs from the previous verification.

#### 3.2 Project approval by Parties involved (90-91)

The written project approval (ref /3/) by the Netherlands was issued on 01/06/2010 by the DFP of that Party (NL Agency) when submitting the first verification report to the secretariat for publication in accordance with paragraph 38 of the JI guidelines, at the latest.

The above mentioned written approval is unconditional (the Project approval does not provide any specific additional conditions for the Project implementation and monitoring).

## 3.3 Project implementation (92-93)

The purpose of the project is the reduction of nitrous oxide (N2O) emissions from nitric acid production Lines at the nitric acid plant of AB Achema. The Company is situated in Jonava, Lithuania.

Achema operates two nitric acid production lines, one manufactured by Grande Paroisse, the other by UKL. This project relates to the UKL-7 line. The plant has a nameplate capacity of 2,800 tonnes of nitric acid per day of operation. UKL-7 plant consists of 8 separate production lines. Each line has its own ammonia and air preparation and feeding system, oxidation chamber, heat exchange system, turbine and absorption tower with individual production schedules (production shutdowns, primary catalyst gauze changes, operating conditions). Tail gas ducts of individual production lines are connected to the common tail gas duct which takes the tail gas to 2 stacks, from which N2O is emitted to the atmosphere.

#### **VERIFICATION REPORT**

The installation of a secondary N2O reduction catalyst underneath the primary catalyst precious metal catching and catalytic gauzes package in the ammonium burner was applied in 8 production lines of Achema UKL-7 nitric acid plant in the period from April 2008 through December 2008. In the presence of this catalyst, N2O is broken down into harmless constituents of N2 and O2.

The secondary catalyst was placed in the appropriate support structure. The gap between the edge of the support structure and the inside wall of the ammonia burner was sealed to prevent the process gas by-passing the secondary catalyst. In this way the technology ensures that all gases which pass through the primary catalyst will also pass through the secondary catalyst.

AMS installed at the operating plant is in compliance with the European norm EN14181, which assumes three levels of quality assurance of the measurement systems - QAL1, QAL2 and QAL3.

The first level (QAL1) is assured and certified by the measurement equipment provider and it refers to the performance and accuracy of the system. The second level of quality assurance (QAL2) guarantees the correct installation of the AMS and its proper operation at the plant. The third level (QAL3) is aimed to guarantee the maintenance and regular proper functioning of the measurement equipment and the measurement data provided (see Annex A section 101 (b) for details on means of verification).

An N2O emission monitoring system is installed in 8 nitric acid lines of the plant, each with its own burner, absorption column and expansion turbine. Each production Line represents a separate nitric acid production unit, independent from each other.

The primary catalyst is changed at different times thus it is necessary to measure the emissions from each Line individually. This means that eight separate sets of monitoring equipment are installed to measure tail gas flow, nitric acid production, nitric acid concentration, and the operating conditions. N2O concentration in the tail gas is measured by 3 switched concentration meters. This monitoring plan change have been reviewed and validated during the 2<sup>nd</sup> verification already.

The project activity is completely operational and this has been confirmed during an on-site audit.

The project is implemented according to the description presented in the registered PDD. There are no project changes implemented after the previous verification.

BUREAU VERITAS

**VERIFICATION REPORT** 

# 3.4 Compliance of the monitoring plan with the monitoring methodology (94-98)

The monitoring occurred in accordance with the monitoring plan included in the PDD version 5 regarding which the determination has been deemed final and is so listed on the UNFCCC JI website:

http://ji.unfccc.int/JI\_Projects/DB/J2GCVCU6V2WU85ALR6GTD36P7QXIQQ/Determination/DNV-CUK1246515672.87/viewDeterminationReport.html, also taking into account monitoring plan revision dated 25/01/2011 which has been validated during the second verification already (see 2<sup>nd</sup> verification report, section 3.4 for more information).

Excel based calculation spreadsheets "THE N2O EMISSION REDUCTION CALCULATION MODEL (CALCULATION MODEL)" are developed to comply with the methodology AM0034 for "Catalytic reduction of N2O inside the ammonia burner of nitric acid plants" and the Monitoring plan. The tool's operating principles are clearly described in the ACHEMA N2O EMISSION REDUCTION PROJECT MODEL USER MANUAL (MODEL MANUAL)" (ref /6/).

MODEL MANUAL and CALCULATION MODEL were analyzed to ensure that the requirements of the AM0034 and Monitoring plan are fulfilled. All assumptions and references to the original data sources are clearly demonstrated, e.g. monitoring data, calibration parameters, nameplate capacity, the limit of extreme values. Emission factors are calculated using CALCULATION MODEL. Formulas and assumptions were verified and no discrepancies or mistakes found. Default emission reduction factors are not used.

CL 1 and CL2 which were related with monitoring plan have been resolved efficiently, see Annex 1 for more details.

### 3.5 Revision of monitoring plan (99-100)

Monitoring report was not revised during the 4<sup>th</sup> monitoring period.

## 3.6 Data management (101)

All data collection procedures are implemented in accordance with the monitoring plan and JI MANUAL

The Excel file of daily event register and N2O monitoring data (all raw data) are collected in EcoLogger system in an Excel file. After the end of the project campaign the Head Deputy of the Plant sends all campaign data to Vertis Environmental Finance, they paste the data to CALCULATION MODEL.

All CALCULATION MODELS are stored on the Vertis server in line with the storage requirements defined in the PDD for other project parameters. The models are always, prior to sending to the verifier and publishing on

#### **VERIFICATION REPORT**

the UNFCCC website, subjected to the internal quality control. This control consists of the control of the emission data as provided by Achema. These data are checked for their completeness and time accuracy. Further calculations are done by the project analyst and the results are audited by the supervising manager who has created the model and has excellent knowledge of its functionalities.

The Measurement equipment (including the Automatic measurement system and the Measurement system) is controlled and calibrated according to the requirements of JI MANUAL procedures.

CL 3-4 which were related with data management, have been resolved efficiently, and FAR1 will be reviewed during the next verification, see Annex 1 for more details.

# 3.7 Verification regarding programmes of activities (102-110)

Not applicable.

Report No: LITHUANIA-VER/0048/201
-----------------------------------

#### 4 VERIFICATION OPINION

Bureau Veritas Certification has performed the 4th periodic verification of the JI Track II Project "ACHEMA UKL-7 plant N2O abatement project", located in Lithuania which applies the AM0034 "Catalyst reduction of N2O inside the ammonia burner of nitric acid plants" v02. The verification was performed on the basis of UNFCCC criteria and the host country criteria and also on the criteria given to provide for consistent project operations, monitoring and reporting.

The verification consisted of the following three phases: i) desk review of the project design and the baseline and monitoring plan; ii) follow-up interviews with project stakeholders; iii) resolution of outstanding issues and the issuance of the final verification report and opinion.

The management of ACHEMA, AB is responsible for the preparation of the data on GHG emission and the reported GHG emission reductions of the project on the basis set out within the project Monitoring and Verification Plan indicated in the final PDD version 5 issued on 07/09/2009. The development and maintenance of records and reporting procedures in accordance with that plan, including the calculation and determination of GHG emission reductions from the project, is the responsibility of the management of the project.

Bureau Veritas Certification verified the Project Monitoring Report version dated 20 April 2012 for the reporting period as indicated below. Bureau Veritas Certification confirms that the project is implemented as planned and described in the approved project design documents. The installed equipment being essential for generating emission reduction runs reliably and is calibrated appropriately. The monitoring system is in place and the project is generating GHG emission reductions.

Bureau Veritas Certification can confirm that the GHG emission reduction is accurately calculated and is free of material errors, omissions or misstatements. Our opinion relates to the project's GHG emissions and resulting GHG emission reductions reported and related to the approved project baseline and monitoring, and its associated documents. Based on the information we have seen and evaluated, we confirm, with a reasonable level of assurance, the following statement:

Reporting period: From 13/09/2010 to 08/12/2011

Emission Reductions (year 2010): 200103 t CO2 equivalents Emission Reductions (year 2011): 964893 t CO2 equivalents. Emission Reductions (total): 1164996 t CO2 equivalents.

DVM Paragraph	Check Item	Initial findi	ng	_	Draft Conclusion	Final Conclusion
94	Did the monitoring occur in accordance with the monitoring plan included in the PDD regarding which the determination has been deemed final and is so listed on the UNFCCC JI website?	The Excel based calculation tool "THE N2O EMISSION REDUCTION CALCULATION MODEL (CALCULATION MODEL) is developed to comply with the methodology AM0034 for "Catalytic reduction of N2O inside the ammonia burner of nitric acid plants" and the monitoring plan. The tool's operating principles are clearly described in the ACHEMA N2O EMISSION REDUCTION PROJECT MODEL USER MANUAL (MODEL MANUAL)".  MODEL MANUAL and CALCULATION MODEL were analyzed to ensure that the requirements of the AM0034 and the monitoring plan are fulfilled. The results of this analysis are described in the table below:		CL1,CL2	O.K.	
		Requirement	Results	]		
		Determination of the permitted operating conditions of the nitric acid plant to avoid overestimation of baseline emissions				
		- oxidation temperature and pressure (permitted range from PDD)	O.K.*			
		- ammonia gas flow rates and ammonia to air ratio input into the ammonia oxidation reactor (permitted range from PDD)	O.K.*

DVM Paragraph	Check Item	Initial finding	Draft Conclusion	Final Conclusion
		* have been validated during the first verification  CL1: Please explain in the monitoring report how this AM00034 requirement for project campaign length was applied for lines 2,4 and 5 (when project campaigns was shorter than historical campaigns): "b. Shorter Project Campaign  If CLn < CLnormal, recalculate EF <sub>BL</sub> by eliminating those N2O values that were obtained during the production of tonnes of nitric acid beyond the CLn (i.e. the last tonnes produced) from the calculation of EFn".  CL2: Please provide evidences that the same catalyst composition was used for baseline and project campaign (CL is applicable for Lines 1, 2, 4).		
95 (a)	For calculating the emission reductions or enhancements of net removals, were key factors, e.g. those listed in 23 (b) (i)-(vii) above, influencing the baseline emissions or net removals and the activity level of the project and the emissions or removals as well as risks associated with the project taken into account, as appropriate?	See 94 above.	O.K.	O.K.
95 (b)	Are data sources used for calculating emission reductions or enhancements of net removals clearly identified, reliable and transparent?	The CALCULATION MODEL is designed in such a way, that all automatic links are implemented inside the spreadsheet and the model performs emission reduction calculations automatically. All assumptions and references to the original data sources are clearly demonstrated, e.g. monitoring data, calibration parameters, nameplate capacity, the limit of extreme values, except for CL3: CL3: There is a statement in the monitoring report that "Operating hours defined as hours, when nitric acid production at least 0.1	CL3	O.K.

Data manage	ement			
101 (a)	Is the implementation of data collection procedures in accordance with the monitoring plan, including the quality control and quality assurance procedures?	All data collection procedures are implemented in accordance with the monitoring plan. The Excel file of daily event register and N2O monitoring data (all raw data) are collected in EcoLogger system in an Excel file. After the end of the project campaign the Head Deputy of the Plant sends all campaign data to Vertis Environmental Finance, they paste the data to CALCULATION MODEL.  All CALCULATION MODELS are stored on the Vertis server in line with the storage requirements defined in the PDD for other project parameters. The models are always, prior to sending to the verifier and publishing on the UNFCCC website, subjected to the internal quality control. This control consists of the control of the emission data as provided by Achema. These data are checked for their completeness and time accuracy. Further calculations are done by the project analyst and the results are audited by the supervising manager who has created the model and has excellent	O.K.	O.K.

108	Has the AIE made site inspections of at least the square root of the number of total JPAs, rounded to the upper whole number? If the AIE makes no site inspections or fewer site inspections than the square root of the number of total JPAs, rounded to the upper whole number, then does the AIE provide a reasonable explanation and justification?	Not applicable.	O.K.	O.K.
109	Is the sampling plan available for submission to the secretariat for the JISC.s ex ante assessment? (Optional)	Not applicable.	O.K.	O.K.
110	If the AIE learns of a fraudulently included JPA, a fraudulently monitored JPA or an inflated number of emission reductions claimed in a JI PoA, has the AIE informed the JISC of the fraud in writing?	Not applicable.	O.K.	O.K.

 Table 2
 Resolution of Corrective Action and Clarification Requests

Draft report clarifications and corrective action requests by validation team	Ref. to checklist question in table 1	Summary of project participant response	Verification team conclusion
CL1: Please explain in the monitoring report how AM00034 requirement for project campaign length was applied for lines 2,4 and 5 (when project campaigns was shorter than historical campaigns): "b. Shorter Project Campaign If CLn < CLnormal, recalculate EF <sub>BL</sub> by eliminating those N2O values that were obtained during the production of tonnes of nitric acid beyond the CLn (i.e. the last tonnes produced) from the calculation of EFn"	94	The text in the revised monitoring report section 3.3 is replaced with the following text:  The average historic campaign length (CL <sub>normal</sub> ) defined as the average campaign length for the historic campaigns used to define operating condition (the previous 5 campaigns), has been used as a cap on the length of the baseline campaign.  And following text is added text to the section under 4.3:  Because the nitric acid production during the project was higher than the baseline, all of the baseline NCSG values were used to determine the baseline emission factor.	Revised monitoring report was found in accordance with ACM0034 methodology, hence CL1 is closed.
CL2: Please provide evidences that the same catalyst composition was used for baseline and project campaign (CL is applicable for Lines 1, 2, 4).	94	Statement of the catalyst supplier (Johnson Matthey) was provided that the same composition of the primary catalyst was used during the specific baseline and project campaigns.	Statement (dated 10/04/2012, ref 20) was found acceptable as an evidence, hence CL2 is closed.

CL3: There is a statement in the monitoring report that "Operating hours defined as hours, when nitric acid production at least 0.1 tHNO3 and oxidation temperature at least 600°C occurred". 600 °C temperature level is defined in PLANT MANUAL also as temperature of the operation start. Please, clarify why temperature 704 °C is defined as minimum temperature in the CALCULATION MODEL sheet Summary, cell C185. This CL is applicable for Lines 1 and 6.	101 (b)	In all the CALCULATION MODELS sheet Summary, cell C185, the value is corrected to "600 °C". Recalculated MODELS and the revised accordingly monitoring report version is provided for verification.	Revised CALCULATION MODELS For Lines 1 and 6 were reviewed and found in accordance with the monitoring plan and plant manual. Recalculation has not impacted emission reduction calculation results. Hence CL2 is closed.
CL4: 2009.12.09 is referenced as QAL2 test (used for new regression line) date in the Line 3 CALCULATION MODEL, but the latest QAL2 test report is dated 2010.03.01. Please clarify.	101 (b)	Typing mistake is revised in the Line 3 CALCULATION MODEL.	Revised QAL2 test date was found correct, hence CL4 is closed.
FAR1: Please provide final AST test report version for Lines 1,4,5,8,9 (date of test 11.12.2011 – 16.12.2011, date of preliminary report 30/03/2012).	101 (b)	Final report version is not provided yet by AIRTEC at the time.	Since there are no any open issues in the preliminary version, final AST report version will be reviewed during the next verification.
