Verification Report

Noun Energy Romania SRL

**First Periodic Verification
of the JI track 1 project
Municipal Cogeneration Targoviste
(Romania)**

Report No. 1096910

27 April 2011

TÜV SÜD Industrie Service GmbH
Carbon Management Service
Westendstr. 199 - 80686 Munich - GERMANY

Report No.	Date of first issue	Version	Date of this revision	Certificate No.
1096910	09-02-2011	02	27-04-2011	
Subject:		First Periodic Verification (for 2006 and 2007 a pre-JI verification has been done)		
Executing Operational Unit:				
TÜV SÜD Industrie Service GmbH, Carbon Management Service Westendstrasse 199 - 80686 Munich, Federal Republic of Germany				
Project Participant:				
Nuon Energy Romania SRL, Frigoriferului Nr 6 Hala 4, Sibiu, România (AIE contractor) N.V. Nuon Warmte, Utrechtseweg 68, 6812 AH Arnhem, Netherlands				
Registration number / Project Title			RO 1000173 / Municipal Cogeneration Targoviste (Romania) Technical Areas: 1.2 /3.1	
Monitoring period:			01-01-2008 to 31-12-2008	
Published Monitoring Report (version/date)			Version 01 / 13-01-2009	
Final Monitoring Report (version/date)			Version 02 / 23-01-2009	
Summary:				
<p>TÜV SÜD Industrie Service GmbH has performed the first periodic verification for 2008 of the JI Track 1 project: "Municipal Cogeneration Targoviste (Romania)" that is registered by the JISC (see link: http://ji.unfccc.int/JIITLProject/DB/JZ3NVK4GDR3I7BVX7BWLWLVBY5ZPTD/details). The management of Nuon Energy Romania SRL is responsible for the preparation of the GHG emissions data and the reported GHG emission reductions. A document review, followed by a site visit was conducted to verify the information submitted by the project participant regarding the present verification period. Based on the assessment carried out, the verifier confirms:</p> <ul style="list-style-type: none"> • that the project has been implemented and operated in accordance with the description given in the registered PDD (24-05-2004) with the attachment for baseline setting (05-12-2008). • that the project is completely implemented as described in the PDD with attachment. • that the monitoring plan complies with the applied methodology (described in PDD with attachment) and the monitoring has been carried out as exactly following the monitoring plan. <p>Installed equipments essential for generating emission reductions run reliably and the meters are calibrated appropriately. The project is generating emission reductions that are to be issued as <u>ERUs</u>.</p> <p>The verifier can confirm that the GHG emission reductions are calculated without material misstatements. Our opinion refers to the project's GHG emissions and resulting GHG emission reductions reported, both determined due to the valid and project's baseline, its monitoring plan and its associated documents. Based on the information we have seen and evaluated we confirm that the implementation of the project resulted in 52,523 t CO₂e in 2008. The figures are lower than the ex-ante estimated figures in the PDD. This is due to a lower demand than expected.</p>

1. INTRODUCTION

1.1 Objective

Nuon Energy Romania SRL ordered independent first periodic verification services for the MUNICIPAL COGENERATION TÂRGOVIȘTE (ROMANIA) by TÜV SÜD. For the years 2006 and 2007 pre-JI verification has been performed by TÜV SÜD.

The objective of the verification work is to check the compliance of the project with the requirements of paragraph 62 of the CDM Modalities and Procedures. According to this assessment TÜV SÜD shall:

- ensure that the project activity has been implemented and operated as per the PDD with attachment "MUNICIPAL COGENERATION TÂRGOVIȘTE (ROMANIA)" Version PDD 24-05-2004 with attachment from 05-12-2008, and that all physical features (technology, project equipment, monitoring and metering equipment) of the project are in place,
- ensure that the published MR and other supporting documents provided are complete and verifiable and in accordance with applicable JI requirements,
- ensure that actual monitoring systems and procedures comply with the monitoring systems and procedures described in the monitoring plan and the project specific methodology,
- evaluate the data recorded and stored as per Monitoring Plan described in PDD with attachment.
- The official link to the published documents is:
http://www.netinform.net/KE/Wegweiser/Guide22.aspx?ID=5973&Ebene1_ID=50&Ebene2_ID=1901&mode=5

The verified emission reduction figures are lower than the ex-ante estimated figures in the PDD that is due to a lower demand than expected. However, this fact does not affect the verification of the project.

1.2 Scope

The verification scope is defined as an independent and objective review and ex-post determination of the monitored reductions in GHG emissions by the Accredited Independent Entity. The verification is based on the submitted monitoring report, the determined project design documents including its monitoring plan and re-determination report, initial, first and second periodic verification report, the applied monitoring methodology, relevant decisions, clarifications and guidance from the CMP and the JISC and any other information and references relevant to the project activity's resulting emission reductions. These documents are reviewed against the requirements of the Kyoto Protocol, the CDM Modalities and Procedures and related rules and guidance.

TÜV SÜD has, based on the requirements in the DVM applied a risk based approach. The principles of accuracy and completeness, relevance, reliability and credibility were combined with a conservative approach to establish a traceable and transparent verification opinion.

The verification considers both quantitative and qualitative information on emission reductions.

The verification is not meant to provide any consultancy towards the client. However, stated requests for clarifications, corrective and/or forward actions may provide input for improvement of the monitoring activities.

1.3 GHG Project Description

Project activity:	“MUNICIPAL COGENERATION TÂRGOVIȘTE (ROMANIA)”
UNFCCC registration number:	1096910
Project Participants:	City Hall Târgoviște – Ms. Ana George Bogdan – Vice Mayor (owner of Termica); S.C. Termica S.A. – Mr. Viorel Tabacu – General Manager (operator of the project); S.C. Nuon Energy Romania Srl. – Leo Paulissen (CO ₂ credits owner)
Location of the project:	GPS coordinates 44° 54' 59" Nord; 25° 26' 33" East.

The core part of the project was to install new cogeneration facilities with a total capacity of about 6.8 MWe and new heat only boilers with a capacity of 14.0 MWth, as well as to rehabilitate the existing heat transportation networks and an existing heat only boiler with a capacity of 58.2 MWth. The installations found during verification audit were in compliance with the project design. The project intends to solve the heat supply problems in the City of Târgoviște, and to drastically improve the efficiency of electricity and heat production and it produces electricity and heat at lower cost and environmental friendlier than at present. The produced electricity will be partly consumed internally by the beneficiaries of the project and partly sold to a third party, whereas the produced heat will be delivered to the customers of S.C. TERMICA S.A., which is the municipality owned operator of the plant.

2 METHODOLOGY

2.1 Verification Process

The verification process is based on the approach depicted in the DVM (Annex 4, JISC 19).

Standard auditing techniques have been adopted. The verification team performs first a desk review, followed by an on-site visit which results in a protocol including all the findings. The next step is to close out the findings through direct communication with the PPs and finally prepare the verification report. This verification report and other supporting documents then undergo an internal quality control by the CB “climate and energy” before submission to the host country DFP.

2.2 Verification Team

The appointment of the team takes into account the coverage of the technical areas, sectoral scopes and relevant host country experience for verifying the ER achieved by the project activity in the relevant monitoring period for this verification.

The verification team was consisting of the following members:

Name	Qualification	Coverage of technical area 1.2	Coverage of technical area 3.1	Host country experience
Robert Mitterwallner	ATL	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>
Madis Maddison	VER	<input checked="" type="checkbox"/>		
Laura Vaida	T			<input checked="" type="checkbox"/>

Robert Mitterwallner is located at TUV SÜD Industrie Service in Munich since 1990 and has a background as auditor for environmental management systems, as expert in environmental permit procedures for industrial plants and as expert for environmental impact studies assessment. He has received training in the JI determination/verification and CDM validation/verification process and applied successfully as GHG Determiner, GHG Validator, GHG Verifier as well as Assessment Team Leader and Technical Reviewer for climate change projects, among others, in the scope energy industries. Moreover, he has been appointed as Auditor for Renewable Energy Certification.

Madis Maddison is specialized in auditing of greenhouse gas emission reduction projects. This experience he has gained (in co-operation with TÜV Süd Industrie Service) in determination and verification of Joint Implementation (JI) projects in Estonia, Lithuania, Poland, Romania and Bulgaria. He has received training in the JI determination as well as CDM validation and verification process and applied successfully as GHG Auditor.

Laura Vaida - is engineer from Romania with B.Sc. in Engineering and Management of Production Systems. She has work experience in the field of mechanical engineering and quality assurance. As GHG trainee she has been appointed scopes 4 and 9 as per UNFCCC definition.

2.3 Review of Documents

The Monitoring Report version 02 was submitted by the PP which was made publicly available on the netinform website before the verification activities started. The published MR was assessed based on all the relevant documents as listed earlier. The aim of the assessment in the desk review was to verify the completeness of the data and the information presented in the MR. The compliance check of the MR with respect to the monitoring plan depicted in the PDD with attachment and the project specific methodology was carried out. Particular attention to the frequency of measurements, the quality of the metering equipment including calibration requirements, and the quality assurance and quality control procedures was paid. The evaluation of data management and the quality assurance and quality control system in the context of their influence on the generation and reporting of emission reductions was also carried out. A complete list of all documents reviewed is available in Annex 2 of this report.

2.4 On-site Assessment and follow-up Interviews

During 23 and 24-03-2009, TÜV SÜD performed (together with the pre-JI verification) a physical site inspection and on-site interviews with project stakeholders to:

- confirm the implementation and operation of the project,
- review the data flow for generating, aggregating and reporting the monitoring parameters,
- confirm the correct implementation of procedures for operations and data collection,
- cross-check the information provided in the MR documentation with other sources (raw data),
- check the monitoring equipments against the requirements of the PDD with attachment and the project specific methodology, including calibrations, maintenance, etc.,
- review the calculations and assumptions used to obtain the GHG data and ER,
- Identify if the quality control and quality assurance procedures are in place to prevent or correct errors or omissions in the reported parameters.

The following persons were interviewed during this verification activity:

1. Mr. Viorel Tabacu, S.C. Termica S.A. General Manager (operator of the project);
2. Mr. Leo Paulissen, General Manager S.C. Nuon Energy Romania Srl. (CO2 credits owner).
3. Mr. Ioan Isaila – Engineer, Nuon Energy Romania
4. Mr. Marius Sala – Interpreter S.C. TERMICA S.A. Targoviste

2.5 Quality of Evidence to Determine Emission Reductions

Among many others the following relevant and reliable evidences have been used by the audit team during the verification process:

1. Operational reports of the Plant including Failure Register;
2. Monitoring report for 2008
3. Heat production records;
4. Reports on heat delivered to secondary network;
5. Reports on produced electricity;
6. Gas consumption reports;
7. Invoices of electricity sold to the grid;
8. Invoices of consumed gas
9. Initial, first and second periodic Verification Report;

Sufficient evidence covering the full verification period in the required frequency is available to validate the figures stated in the final MR. The source of the evidences will be discussed in chapter 3 of this report. Specific cross-checks have been done in cases that further sources were

available. All figures in the monitoring report were cross-checked by the audit team against the raw data. The data collection system meets the requirements of the monitoring plan as per the project specific methodology.

2.6 Resolution of Clarification and Corrective and Forward Action Requests

The objective of this phase of the verification process was to resolve any outstanding issues which needed to be clarified for TÜV SÜD's positive conclusion on the GHG emission reduction calculation. The findings raised as Forward Action Requests (FARs) (if any) indicated in previous reports (determination/verification) were clarified during communications between the PP and TÜV SÜD.

To guarantee the transparency of the verification process, the concerns raised, based on the desk review and subsequent on-site audit assessment and follow up interviews, together with the responses given are documented in Annex 1 (verification protocol).

A Corrective Action Request is raised where TÜV SÜD identifies:

- non-conformities in monitoring and/or reporting with the monitoring plan and/or methodology;
- that the evidence provided is not sufficient to prove conformity;
- mistakes in assumptions, data or calculations that impair the ER;
- FARs stated during determination that are not solved until the on-site visit.

A Clarification Request is raised where TÜV SÜD does not have enough information or the information is not clear in order to confirm a statement or data.

A Forward Action Request is raised where TÜV SÜD identifies that monitoring and/or reporting required special attention or adjustments for the next verification period.

Information or clarifications provided as response to a CAR, CL or FAR could also lead to a new CAR.

2.7 Internal Quality Control

As an ultimate step of verification the final documentation including the verification report and the protocol have to undergo an internal quality control by the Certification Body (CB) "climate and energy", i.e. each report has to be finally approved either by the Head of the CB or the Deputy. In case one of these two persons is part of the assessment team the approval can only be given by the other one. If the documents have been satisfactorily approved, the Request for Issuance is submitted to the host country DFP along with the relevant documents.

3 VERIFICATION RESULTS

In the following sections the results of the verification are stated. The verification results relate to the project performance as documented and described in the final Monitoring Report Version 02 / 23-01-2009 for the year 2008. The verification findings are presented below.

3.1 FARs from Previous Verification

There was 1 Forward Action Request raised in the pre-JI Verification Report No. 1096909 by TÜV SÜD Industrie Service GmbH. Since the audit for 2008 data has been performed together with the previous verification, the FAR has to be solved until the second periodic verification under JI track 1.

3.2 Project Implementation in accordance with the PDD with attachment

The project is fully implemented according to the description presented in the PDD with attachment. The verifier confirms, through the visual inspection that all physical features of the proposed JI project activity including data collecting systems and storage have been implemented in accordance with the PDD with attachment. The project activity is completely operational and the same has been confirmed on-site.

No data and/or variables presented in the MR differ significantly from the stated in the PDD with attachment, which would to cause an increment of the ER in this period or in future periods in relation to the estimates in the PDD with attachment.

3.3 Compliance of the Monitoring with the Monitoring Plan

The monitoring has been carried out in accordance with the monitoring plan contained in the PDD with attachment. All parameters were monitored and determined as per the Monitoring Plan.

The verification of the parameters required by the monitoring plan are provided as follows:

Data / Parameter:	Heat production total
Data unit:	MWh
Description:	Total annual heat produced through all systems in the project boundaries.
Source of data used:	Monitoring is based on meter readings. There are heat meters installed at every steam boiler and cogeneration engine, see Annex 1 table 3.2.1. All meters are fully functional and properly calibrated.

Means of verification/Comments:	The amount of heat produced was verified by entering randomly selected raw data into calculation of annual totals.
Cross-check	The heat production of the Plant was crosschecked by comparing it to the Reports on produced heat (printouts from SCADA).

Data / Parameter:	Net Electricity production
Data unit:	MWh
Description:	The net electricity produced in the generators within the boundaries of the project.
Source of data used:	Monitoring is based on power meter readings. There are electricity meters installed at every cogeneration engine, see Annex 1 table 3.2.2. All meters are fully functional and properly calibrated.
Means of verification/Comments:	The amount of net electricity produced was verified by entering randomly selected raw data into calculation of annual totals.
Cross-check	The net electricity production of the Plant was crosschecked by comparing it to the Reports on produced heat (printouts from SCADA).

Data / Parameter:	Total gas consumption
Data unit:	Nm ³
Description:	The total volume of gas consumed for the production of energy within the boundaries of the project.
Source of data used:	Monitoring is based on gas meter readings. There is a gas meter installed at the gas supply pipeline, see Annex 1 table 3.2.3. The meter is fully functional and properly calibrated.
Means of verification/Comments:	The amount of gas consumption was verified by entering randomly selected raw data from monthly bills from the gas supplier into calculation sheet.
Cross-check	The gas consumption was crosschecked by comparing it to the Reports on produced heat (printouts from SCADA).

Data / Parameter:	Heat delivered to secondary network
Data unit:	MWh
Description:	The total heat delivered outside the boundaries of the project including make-up water for the secondary network.
Source of data used:	Monitoring is based on heat meter readings. The total heat delivered outside the boundaries of the project is metered at every thermal point in the city in 55 locations. At each thermal point heat is metered by two meters (in total 110 meters): main heat meter and make-up water for the secondary network, see Annex 1 table 3.2.4. The meters are fully functional and properly calibrated.
Means of verification/Comments:	The amount of heat delivered to secondary network was verified by entering randomly selected raw data from the monthly readings into calculation sheet.
Cross-check	The heat delivered to secondary network was crosschecked by comparing it to the Reports on produced heat (printouts from SCADA).

Data / Parameter:	Natural Gas lower Calorific value
Data unit:	KCal/m ³
Description:	The Natural Gas lower Calorific value is used to compute the Consumed Energy
Source of data used:	Monitoring is based on the data issued by Romanian Energy Regulatory Authority. The value is a public one established by the national authority in the field in Romania and therefore its level uncertainty could be considered as acceptable
Means of verification/Comments:	The Natural Gas lower Calorific value was verified with the result from the Analysis Report from Distrigaz Sud.
Cross-check	The Natural Gas lower Calorific value was cross-checked from http://www.transgaz.ro/puteri_calorifice.php .

All other parameters used in ERU calculations (such as Specific CO₂ Emissions for gas and lignite, Theoretical gas consumption of the gas engines, Heat losses in transport network, The gas boiler net efficiency and Electric efficiency lignite fired plant) were fixed in PDD with attachment and do not require monitoring.

3.4 Assessment of Data and Calculation of Greenhouse Gas Emission Reductions

All data has been available and all the parameters have been monitored in accordance with the registered monitoring plan.

The reported data has been cross check against other sources when available as explained above in chapter 3.3.

The verifier confirms that the methods and formulae used to obtain the baseline, project and leakage emissions are appropriate. The same have been done in accordance with the methods and formulae described in the monitoring plan and project specific methodology.

The verifier confirms that all the emission factors and default values (ex-ante values from PDD with attachment) have been correctly justified.

4 SUMMARY OF FINDINGS

The verifier can confirm that the published MR and related documents are complete and verifiable in accordance with the JI requirements. All the findings raised by the verification team, the responses by the PPs and the conclusion from the team are presented in Annex 1.

All together 20 Clarification Requests and one Forward Action Request were issued.

The most important CRs are listed herewith:

CL # 4: A clarification request related to what happens in case of data discrepancies. As response of the PP, no case of data discrepancies was present up to now. Often readings of meters will make available a wide set of readings. If any wrong reading of meter appears it will not affect the result of the monitoring because this information will not be used, but the closest good information which will be available at distance of maximum 24 hours and will not affect the results of data monitoring at year level. The issue is considered solved for the audit team.

CL # 11: Another clarification request was about the last calibration date for the plant heat meters. As for the PP, this information can be found in the centralizer (excel table) with all the meters in the plant. It can be concluded by the audit team, that this information is presented in the file "Meters Plant Centralizer_090520.xls" (IRL12).

CL # 19: A clarification request related to data processing and interpretation in order to clarify the aspect of data reliability and plausibility. As for PP, this information is available on the CD-ROM given to AIE representatives on 240309, during the visit in Targoviste. A copy of the data processing and interpretation was received from PP (IRL16 and IRL17). Hence, the issue is considered solved.

FAR#1: A Forward Action Request related to "Written (paper or digital) procedure for data transfer shall replace verbal transfer" was issued because the data transfer from the operator to the Control Room is currently done only verbally by phone and there is a certain risk of misunderstanding the data or wrong interpretation of the message. The Project Owner agreed and stated that "The Project includes an automatic data collection / storage system, part of SCADA system. Data collection is still under verification and can be used for data verification if needed." The issue shall be checked and dealt with during the next verification audit.

Industrie Service

5 VERIFICATION STATEMENT

TÜV SÜD Industrie Service GmbH has performed the first periodic verification of the JI track 1 project: "MUNICIPAL COGENERATION TÂRGOVIȘTE (ROMANIA)". The verification is based on the currently valid documentation of the UN Framework Convention on Climate Change (UNFCCC).

The management of S.C. Termica S.A. is responsible for the preparation of the GHG emissions data and the reported GHG emission reductions on the basis set out within the project's Monitoring Plan indicated in the PDD from 2004 and the attachment to the PDD and the project specific methodology. The verifier can confirm that:

- the development and maintenance of records and reporting procedures are in accordance with the monitoring plan;
- the project is operated as planned and described in the re-determined PDD with attachment;
- the installed equipment being essential for generating emission reduction runs reliably and is calibrated appropriately;
- the monitoring system is in place and generates GHG emission reductions data;
- the GHG emission reductions are calculated without material misstatements;
- the monitoring plan in Monitoring Report is as per the PDD with attachment;
- the monitoring plan in the PDD with attachment is as per the project specific methodology.

The verified emission reduction figures are lower than the ex-ante estimated figures in the PDD that is due to a lower demand than expected. However, this fact does not affect the verification of the project. Our opinion refers to the project's GHG emissions and resulting GHG emission reductions reported both determined due to the valid project's baseline, its monitoring plan and its associated documents. Based on the information we have seen and evaluated, we confirm the following statement. Verified emissions in the above reporting period to be issued as ERUs:

Reporting period	From 01-01-2008 to 31-12-2008
Baseline emissions	94,661 tCO ₂ e
Project emissions	42,138 tCO ₂ e
Leakage emission:	0.0 tCO ₂ e
Emission reductions:	52,523 tCO ₂ e

PDD	Verified Situation	Conclusion
Remarks to Special Operational Status During the Verification Period	<i>The steam boiler shall be used only for process purposes. It is under refurbishment since 2007. The HOB 6, HOB 7, HOB 8 are designated as peak load boilers and back-up boiler for the other boilers and engines. They are in the final stage of construction but they have not reached the stage of testing. However these boilers are not the part of JI project.</i>	<input checked="" type="checkbox"/>

		<i>computers</i>	
<i>Form b</i>	<i>N/A</i>	<i>N/A</i>	<i>N/A</i>
<i>Form c</i>	<i>N/A</i>	<i>N/A</i>	<i>N/A</i>
<i>Form d</i>	<i>N/A</i>	<i>N/A</i>	<i>N/A</i>
<i>Invoice</i>	<i>N/A</i>	<i>N/A</i>	<i>N/A</i>
<i>Form e</i>	<i>N/A</i>	<i>N/A</i>	<i>N/A</i>
<p>Cross-check Approach: The <i>misunderstanding of data or messages wrongly interpreted is eliminated by further data collection and comparison with old data as well as further calculations. The computer from the Control Room used for data storage and computation has a password known by the responsible people in charge with these activities. The eventual faulty inserted or managed data can be checked throughout the other back-up systems (the other four computers). The risks for material misstatement are reduced by these control measures and the remaining risk is low.</i></p> <p>Further Remarks: <i>See FAR # 1</i></p>			<input checked="" type="checkbox"/>

2.4. Data Processing

Description of data processing from transferred data to final results in the calculation tool			
Step	Description	Risks and comments	Concl.
Consistency	<i>There are some changes done since the PDD was developed but they were accepted on the monitoring of 2007. Since then, no further changes were done.</i>	<i>No risks with respect to this issue</i>	<input checked="" type="checkbox"/>
Calculation Tool	<i>The data collected in the Control Room are further used for calcu-</i>	<i>There is a small risk to make a mistake</i>	CL # 4

Verification Protocol, first periodic

Project Title: Municipal Cogeneration Targoviste

Date of Completion: 2011-04-27

Number of Pages: 50

Industrie Service

description	<p><i>lation. The calculation is done by means of excel data sheets. These calculations are done in parallel by Termica and NUON Energy. Any discrepancy in the final results is immediately discussed between the two parties.</i></p> <p><i>There are some changes in the calculation formula determined by faulty meters operation which required utilization of mean data for the period of their faulty operation.</i></p> <p><i>All formulae are clearly described, consistent with the PDD, transparent and using correct units in compliance with the PDD</i></p>	<p><i>in the same way by so that it cannot be seen by all parties because of the wrong reading of the monthly data. The risk is automatically solved either by data interpretations or by future readings.</i></p> <p><i>The risk is to make some wrong calculations far from reality</i></p> <p>CL # 4</p> <p><i>Provide document describing procedure followed in case of data discrepancies.</i></p>	
Transformation from transferred data to useable data	<p><i>Data is missing</i></p> <p><i>Data are incorrect</i></p>	<p><i>No data can be missed. If data is missing, the registers are available and the data is collected again from these registers.</i></p> <p><i>Data are compared with previous data and any discrepancy can be either remarked from data collection or from data computation</i></p>	<input checked="" type="checkbox"/>
Elimination of not plausible data	<p><i>Not plausible data are detected by redundant measurements which are consisting of comparison of energy meters located at the entrance and exist of each Thermal Points. This energy meters represents about 95% of delivered energy.</i></p> <p>CL # 5</p> <p><i>Provide information where is metered the rest of the thermal energy?</i></p>	<p><i>A faulty operation of a meter is immediately noticed by analysing the Thermal Point efficiency where the primary and secondary systems are jointed.</i></p>	CL # 5
Transformation from useable data to input data for further	<p><i>Mean values are used only when faulty data are recorded and the faulty operation of a meter is suspected.</i></p>	<p><i>In such a case, there is a procedure PO-CM-14, which describes the way to handle this situation. This procedure</i></p>	CL # 6

Verification Protocol, first periodic

3.5. External Data

PDD	Verified Situation	Conclusion
External Data		
ID-PDD:	<i>The natural gas lower calorific value is not addressed in the PDD. Over there, the boiler efficiency factor is used instead</i>	<input checked="" type="checkbox"/>
ID-Internal:	<i>Natural gas lower calorific value</i>	<input checked="" type="checkbox"/>
Description of Data / Data Refers to:	<i>This value is used to compute the fuel energy inside the project boundaries</i>	<input checked="" type="checkbox"/>
Unit of Data (if appropriate):	<i>KCal/m3 and further converted in MJ/m3</i>	<input checked="" type="checkbox"/>
Date of Data Income:	<i>The start of the project</i>	<input checked="" type="checkbox"/>
Source of Data:	<i>Romanian Energy Regulatory Authority</i>	<input checked="" type="checkbox"/>
Reliability of Data Source:	<i>The source is reliable</i>	<input checked="" type="checkbox"/>
Is the Data up-to-date?	<i>The current value is 8.057 kcal/m3 which is slightly higher than the one used in calculations</i>	<input checked="" type="checkbox"/>
Uncertainty Level:	<i>The value is a public one established by the national authority in the field in Romania and therefore its level uncertainty could be considered as acceptable</i>	<input checked="" type="checkbox"/>
<p>Cross-check Approach: <i>The values of this parameter could vary mainly based on the source of gas (e.g. Romania, Russia, Azerbaijan, etc.). The current value will determine a variation of 0.065% of the computed value in comparison with the one defined at the beginning of the project. The fluctuation of this value could be in both directions. Nevertheless, considering its range of variation, it could be neglected.</i></p> <p>Further Remarks: <i>No further remarks</i></p>		<input checked="" type="checkbox"/>

4 Data Verification

4.1 Internal Review

Description and performance of internal review			
	Description	Comments	Concl.
Procedure	<p><i>There is a internal Termica procedure "PO-CM-14" (IRL7) which describes the way of data review and actions to be taken when data are found to be wrong</i></p> <p><i>Also the NUON representative is double checking the manually recorded data with the ones recorded by Scada system and takes actions and double check both data sources each time when discrepancies are found between these data</i></p>	<p><i>Both ways of checking are assuring the correctness of data for the previous collections.</i></p>	<p><input checked="" type="checkbox"/></p>
Documentation	<p><i>Only the faulty operation of the meters is documented based on the Termica internal procedure PO-CM-14 (IRL7). Other reviews which reveal no problems are limiting themselves to data collection and comparison</i></p>	<p><i>non</i></p>	<p><input checked="" type="checkbox"/></p>
Responsibilities	<p><i>The dispatcher is responsible to take actions when such faulty operations of the meters are encountered.</i></p>	<p><i>non</i></p>	<p><input checked="" type="checkbox"/></p>
<p>Cross-check Approach: <i>The only problem remaining is to run more than couple of hours with faulty values. Even in this situation the faulty value will be corrected shortly after its appearance based on the average old values from the last hours of meter operation.</i></p> <p><i>This situation is reflecting the scenario when normal boiler/engine operation is taking place.</i></p>			<p><input checked="" type="checkbox"/></p>
<p>Further Remarks: <i>No further remarks.</i></p>			

Verification Protocol, first periodic

Project Title: Municipal Cogeneration Targoviste

4.2 Usage of default values

Description and performance of internal review			
	Description	Comments and Results	Concl.
Procedure	<i>The Termica Internal procedure PO-CM-14 (IRL7) describes the way to handle the situations when faulty meter indications are encountered. In this case, default values are used based on a formula described in this procedure for different scenarios.</i>	<i>The default values are computed based on formulas accepted at the time of PDD development.</i>	<input checked="" type="checkbox"/>
Documentation	<i>The faulty operation of the meters is documented based on the Termica internal procedure PO-CM-14 (IRL7).</i>	<i>The Metrology department is issuing Faulty Operation reports as per PO-CM-14 (IRL7).</i>	<input checked="" type="checkbox"/>
Responsibilities	<i>The dispatcher is responsible to take actions when such faulty operations of the meters are encountered.</i>		<input checked="" type="checkbox"/>
<p>Cross-check Approach: <i>For the gas and heat meters, there is a risk to evaluate too high the heat delivered during the faulty operation of the meter or too low the gas volume used for the production. The risk of default data selection and its calculation should be minimized by the direct relations with the clients considering that the clients will not accept values too high in comparison with the normal ones for the periods of time when the meters are not in operation or revealed faulty values. The same situation is taking place with respect to the gas meters.</i></p> <p>Further Remarks: <i>No further remarks</i></p>			<input checked="" type="checkbox"/>

Verification Protocol, first periodic

4.3 Reproducibility

Description and performance of the assessment			
	Description	Comments and Results	Concl.
Procedure	<i>The calculations were checked by means of verifying the input data collection and transmission.</i>	<i>The values were find reproducible based on the raw data</i>	<input checked="" type="checkbox"/>
Cross-check Approach: <i>As mentioned before, raw data collected are used in calculations and stored by different parties and therefore, the probability of occurrence of mistakes in these processes is highly reduced.</i>			<input checked="" type="checkbox"/>
Further Remarks: <i>No further remarks</i>			

Verification Protocol, first periodic

Project Title: Municipal Cogeneration Targoviste

Date of Completion: 2011-04-27

Number of Pages: 50

Industrie Service

4.4 Peculiarities

Description of Peculiarities and unexpected Daily Events during the verification period			
	Description	Comments and Results	Concl.
Performance	<i>The usual performance of the facility is good. The abnormal operation of the plant is encountered when forced shut-downs occurred because of heating pipes broking down.</i>	<i>These events were considered into calculations as losses resulting from differences between the produced energy and delivered one</i>	<input checked="" type="checkbox"/>
Documentation	<i>These events are documented into Termica daily reports.</i>	<i>The result of such an event is to decrease the CO₂ emissions saved and therefore it increases the conservativeness of the approach</i>	<input checked="" type="checkbox"/>
Measures	<i>Measures are taken to assess the damage causes and to take corrective and preventive measures vis-à-vis such events</i>	<i>These measures are mainly technically oriented</i>	<input checked="" type="checkbox"/>
Further Remarks: <i>No further remarks</i>			<input checked="" type="checkbox"/>

Verification Protocol, first periodic

Project Title: Municipal Cogeneration Targoviste

Date of Completion: 2011-04-27

Number of Pages: 50

Industrie Service

4.5 Reliability and Plausibility

Description of crosschecks and plausibility checks			
	Description	Comments and Results	Concl.
Performance	<p><i>The data are plausible and no faulty should be expected to be found. No discrepancies from the normal trend were found. Some deviations from the smooth variation of data in time were found but they had clear reasons for them.</i></p> <p><i>Data collected, stored and used for calculation in this project are actually crosschecked through the invoicing department.</i></p>	<p><i>Some diagrams analyzed and asked from NUON as attached documents to this paragraph</i></p> <p><i>All reported data must comply and are complying with those introduced in invoices and accepted for payment by the clients.</i></p> <p>CL # 19</p> <p><i>Provide a copy of the data processing and interpretation in order to clarify the aspect of data reliability and plausibility</i></p>	CL # 19
<p>Cross-check Approach: <i>Through invoicing, the risk of increasing the energy delivered values would immediately determine a reaction from the end users of the energy and using lower values of the energy used cannot be done considering the fact that the gas volume is taken from a meter property of the TRANSGAZ which has no interest to accept lower values as they are in reality.</i></p> <p>Further Remarks: <i>No further remarks</i></p>			<input checked="" type="checkbox"/>

Verification Protocol, first periodic

7 Compilation and Resolutions of CARs, CLs and FARs

Corrective Action Requests by audit team	Summary of project owner response	Audit team conclusion
-		
Clarification Requests by audit team	Summary of project owner response	Audit team conclusion
CL # 1 Provide certificates of auditor training for the persons from the Quality Department.	The certificates for trained persons (<i>For Ms. Mariana Mândrescu: Training of Quality Management acc. to ISO 9001 done in 2005</i> <i>Training as Internal Auditor done with QUASARO in 2005</i> <i>For Ms. Valentina Popa: Training as Internal Auditor done with QUASARO in 2005 and Internal Audit for the ISO 14001-ISO 9001 training course done in 2007</i>) were presented.	A copy of the certificates for the trained persons is presented on the CD "CD_TUV_090324" (IRL11; IRL12; IRL13; IRL14) The issue is considered solved. <input checked="" type="checkbox"/>
CL # 2 Provide chemical analysis of gas report from DISTRIGAZ.	The chemical analysis report from DISTRIGAZ was presented.	A copy of the chemical analysis report is presented on the CD "CD_TUV_090324" (IRL7) The issue is considered solved. <input checked="" type="checkbox"/>
CL # 3 Provide procedure of recording data in several places and how is this risk is eliminated.	Data is collected by radio transmission, from the thermal points to the dispatch and written from the plant to the Dispatch. Readings are done at least 1 time in 24 hours. If mistake in data reading or reception they will be corrected at next reading (within maximum 24 hours). Wrong reading will be eliminated or corrected	In the procedure PO-CM-13 (IRL6) and "Municipal Cogeneration Targoviste" and in the document Additional clarification "Completare clarificare CL#5" (IRL5) - "Method of data reading and recording" are presented how data is recorded in several places.

Verification Protocol, first periodic

	<p>and will not affect the end result of the calculation.</p> <p>Collected data is sent via e-mail to the persons involved from Termica and NER one time in 24 hours. This will solve also the safety of data storage, by storing it on more computers.</p> <p>Description of these operations can be found in the procedure PO-CM-13 of Termica, available on the CD-ROM given to TUV representatives on 240309, during the visit in Targoviste</p>	<p>The issue is considered solved.</p> <p style="text-align: center;"><input checked="" type="checkbox"/></p>
<p style="text-align: center;">CL # 4</p> <p>Provide document that presents what happens in case of data discrepancies.</p>	<p>No case of data discrepancies up to now. Often readings of meters will make available a wide set of readings. If any wrong reading of meter appears will not affect the result of the monitoring because this information will not be used, but the closest good information which will be available at distance of maximum 24 hours and will not affect the results of data monitoring at year level.</p>	<p>There was no case of data discrepancies until now.</p> <p>The issue is considered solved.</p> <p style="text-align: center;"><input checked="" type="checkbox"/></p>
<p>CL # 5</p> <p>Provide information where is metered the rest of the thermal energy?</p>	<p>The thermal energy is measured in the plant, at the production units (boiler and engines) and in the thermal points, as supply and make-up energy. These are the measuring points, at the borders of the project.</p>	<p>All the measurement points of the project energy are presented.</p> <p>The issue is considered solved.</p> <p style="text-align: center;"><input checked="" type="checkbox"/></p>
<p>CL # 6</p> <p>Provide the procedure PO-CM 14.</p>	<p>The procedure PO-CM 14 was presented</p>	<p>The procedure PO-CM 14 (IRL7) presents what is happening when faulty data is recorded or when a meter problem is.</p> <p>The issue is considered solved.</p> <p style="text-align: center;"><input checked="" type="checkbox"/></p>

<p>CL # 7 Provide information how it is ensured, that formulas are protected against unauthorized changes?</p>	<p>The interpretation of data and calculation files are done by booth, NER and Termica representatives. Results are compared and verified together. Formulas protection was not possible in Excel. Unauthorized changes into the formulas will not be possible without affecting the end result of a computation in visible way. In case of this happens will be repaired at verification by booth parties.</p>	<p>Due to the fact that the calculation files are done by all the parties involved, any unauthorized changes into the formulas will be visible. This issue is considered solved. <input checked="" type="checkbox"/></p>
<p>CL # 8 Provide information for data interpretation in case of faulty monthly readings.</p>	<p>See CL # 4. Hourly readings available. In case of one wrong reading this will be ignored. As long as the information on the meter is correct wrong reading cannot affect the result of calculation because of wide range of data available, including the data stored in Scada.</p>	<p>The issue is considered solved. <input checked="" type="checkbox"/></p>
<p>CL # 9 Provide list of responsible persons for data interpretation.</p>	<p>Mr. Ioan Isaila – NER Mr. Viorel Tabacu – Termica Mrs. Margareta Ionescu – Termica Mrs. Mariana Mandrescu – Termica</p>	<p>The list of responsible persons for data interpretation is presented. The issue is considered solved. <input checked="" type="checkbox"/></p>
<p>CL # 10 Provide information of commissioning date of heat meters from CAF, from cogeneration and from steam boiler.</p>	<p>This information can be found in the centralizer (excel table) with all the meters in the plant.</p>	<p>This information is presented in the file “Meters Plant Centralizer_090520.xls” (IRL12). The issue is considered solved. <input checked="" type="checkbox"/></p>
<p>CL # 11 Clarify the last calibration date for the plant heat meters.</p>	<p>This information can be found in the centralizer (excel table) with all the meters in the plant.</p>	<p>This information is presented in the file “Meters Plant Centralizer_090520.xls” (IRL12).</p>
